Project Name	Inventory Managment System For Retailers

Create Flask Project:

The image shows a Visual Studio Code editor window with a Python file named `flask_hello_world.py`. The code defines a Flask application with a single route `/` that returns the string `'Hello world this is Dayanand, Maheshwaran, Devaraj and Sabari'`. The application is run using `app.run()`.

Below the code editor, the terminal window shows the command `python flask_hello_world.py` being executed. The output indicates that the Flask application is running on `http://127.0.0.1:5000`. A warning message states: `WARNING: This is a development server. Do not use it in a production deployment. Use a production WSGI server instead.`

At the bottom of the image, a web browser window is open at the address `127.0.0.1:5000`, displaying the text `Hello world this is Dayanand, Maheshwaran, Devaraj and Sabari`.
